

How QuickBooks Remote Access Expands Your Business Options

April 23, 2021

A lot of businesses have been wondering about accessing QuickBooks Desktop remotely. Good news — remote access to QuickBooks Desktop is made possible through cloud hosting. As a result, you can use QuickBooks Desktop from any location, expanding your business options. Swizznet can help you make the move to experience the benefits of hosting over using an in-house server or changing to QuickBooks Online. These are the expanded benefits you can expect when you migrate your QuickBooks Desktop to the cloud.

Keep the Features You Know and Love

Many accountants and business owners find that when they switch to another solution for remote access, such as QuickBooks Online, they miss the full features and ease-of-use they enjoyed with QuickBooks Desktop. There can be a steep learning curve switching from one solution to another that leads to frustrations. And when you rely on certain capabilities for your day-to-day work, it's difficult to find workarounds and create new workflows for missing features.

When you choose QuickBooks Desktop hosting, there is no learning curve — you can keep using QuickBooks with all the features you're accustomed to. Your business can remotely access the QuickBooks Desktop version you know and love in a secure way.

Greater Efficiency

For your business to move faster, you need to ramp up your efficiency. One way to increase efficiency is to switch from an in-house system to a remote cloud server. A remote server allows for anytime access and accommodates room for expansion.

With an in-house server, employees are tied to a single location where all machines are networked to a single server. An online hosting system allows your employees to work wherever internet access is available. Employees will enjoy the flexibility of working from their own homes or while they travel for business. Since they can set their own hours and work during their personal peak times, workers can accomplish more in less time.

QuickBooks Remote Access Makes Expansion Possible

Some business owners want to expand to multiple office locations, which can be next to impossible with an in-house server. If employees must access the same files from multiple offices, QuickBooks remote access is the solution.

All your files live in the cloud server, and all of your employees can log in and access the

system from wherever they like. Even if you set up different offices in several cities or states, you can use the same software for all your client files. This ease of access helps employees manage accounts in expanded locations. Cloud hosting options for QuickBooks will allow your business to make a seamless transition when expanding to different locations.

Reliability You Can Trust

For round-the-clock access to files, a cloud hosting provider must ensure you can gain access no matter what. That's why files are regularly backed up, disaster recovery protocols are established, and files are protected from cyber threats. Swizznet's QuickBooks cloud hosting option delivers all that and more. And if you ever have problems, our outstanding Obsessive Support team can resolve them within minutes.

With an in-house server, you may spend extra time and money on IT help when problems occur. However, you can avoid these hassles with an online hosting option.

QuickBooks Remote Access for You

Swizznet has the right QuickBooks Desktop hosting solutions to help your business expand. But which QuickBooks remote access option is right for you? Contact Swizznet's team at 866-218-7976 to discover more about our packages. We'll help you choose the right option for business expansion.
